

# Natural Computing

LMU Munich  
summer term 2025

Thomas Gabor

Who strongly prefers German?

--	--	--	--

Who strongly prefers English?

--	--	--	--

# Preface

- lecture
- exercises
- exam

current schedule and all further information  
to be found on moodle

<https://moodle.lmu.de/course/view.php?id=38504>

# Material

- what happens in this room
- slides
- video recordings (as much as possible)
- the definition sheet
- exercise sheets (with solutions)
- literature

# Slides

- found on moodle
- versions: preview — raw — scribbled

# Video Recordings

- we try to capture as much as possible
- not everything is guaranteed to be found online

# Video Recordings

We need some help with that!!

# The Definition Sheet

## Natural Computing Definition Sheet

Thomas Gabor  
LMU Munich

Maximilian Zorn  
LMU Munich

Claudia Linnhoff-Popien  
LMU Munich

summer term 2022

**Notation.**  $\wp(X)$  denotes the power set of  $X$ .  $\#$  denotes vector or sequence concatenation, i.e., given two vectors  $\mathbf{x} = \langle x_1, \dots, x_{|\mathbf{x}|} \rangle$  and  $\mathbf{y} = \langle y_1, \dots, y_{|\mathbf{y}|} \rangle$ ,  $\mathbf{x} \# \mathbf{y} = \langle x_1, \dots, x_{|\mathbf{x}|}, y_1, \dots, y_{|\mathbf{y}|} \rangle$ . A vector  $\langle x_0, \dots, x_{n-1} \rangle$  with length  $n \in \mathbb{N}$  can also be written as  $\langle x_i \rangle_{0 \leq i \leq n-1}$  for a new iteration variable  $i$ .  $\cdot$  denotes unspecified function arguments ( $f(\cdot) = 0$  is the constant function that always returns zero, e.g.). We commonly write set operators ( $\in, \subseteq, \wp$  etc.) for multisets where they can be used trivially.

**Definition 1** (Conway's game of life). Let  $G = (V, E)$  be a graph with vertices  $V$  and (undirected) edges  $E \subseteq V \times V$ . We define  $\text{neighborhood} : V \rightarrow \wp(V)$  via  $\text{neighborhood}(v) = \{w \mid (v, w) \in E\}$  as a topology for  $G$ . A state  $x \in \mathcal{X}$  is a mapping of vertices to the labels  $\{\text{dead}, \text{alive}\}$ , i.e., the state space  $\mathcal{X}$  is  $\mathcal{X} = (V \rightarrow \{\text{dead}, \text{alive}\})$ . Let  $x_t$  be a state that exists at time step  $t \in \mathbb{N}$ . We define  $|v|_{x_t} = |\{w \mid w \in \text{neighborhood}(v) \wedge x_t(w) = \text{alive}\}|$ . In the game of life, the evolution of a state  $x_t$  to its subsequent state  $x_{t+1}$  is given deterministically via

$$x_{t+1}(v) = \begin{cases} \text{dead} & \text{if } |v|_{x_t} \leq 1, \\ x_t(v) & \text{if } |v|_{x_t} = 2, \\ \text{alive} & \text{if } |v|_{x_t} = 3, \\ \text{dead} & \text{if } 4 \leq |v|_{x_t}, \end{cases}$$

for all  $v \in V$ . A tuple  $(G, x_S)$  is called an instance of the game of life for initial state  $x_S \in \mathcal{X}$ .

# Exercise Sheets

- published online, solutions discussed in this room, then solution suggestion published online
- include programming exercises

Look forward to...

Max  
Zorn

# Introduction

Natural Computing  
is  
algorithms  
found in or inspired by  
nature.

# A different perspective on computer science

# Does computer science belong among the sciences?

[xkcd.com/435/](http://xkcd.com/435/)

“Computer science is no more about computers  
than astronomy is about telescopes,  
biology is about microscopes  
or chemistry is about beakers and test tubes.”

Michael R. Fellows and Ian Parberry (1993)

[archive.cra.org/CRN/issues/9301.pdf](https://archive.cra.org/CRN/issues/9301.pdf)

“The history of the universe can be thought of as a sequence of information processing revolutions, each of which builds on the technology of the previous ones.”

Seth Lloyd. Programming the Universe. Vintage Books, 2006.

Why nature?

## Physics

quantum computing  
simulated annealing

## Chemistry

particle swarms  
artificial chemistry systems  
cellular automata

## Biology

game of life  
evolutionary algorithms  
neural networks  
social computing

# The Game of Life

# Who knows Conway's Game of Life?

--	--	--	--

**Definition 3** (Conway's game of life (standard)). Let  $G = (V, E)$  be a graph with vertices  $V$  and (undirected) edges  $E \subseteq V \times V$  with a fixed degree of 8 for all nodes. We define  $\text{surroundings} : V \rightarrow \wp(V)$  via

$$\text{surroundings}(v) = \{w \mid (v, w) \in E\}$$

so that  $|\text{surroundings}(v)| = 8$  and  $v \notin \text{surroundings}(v)$  for all  $v \in V$ . A state  $x \in \mathcal{X}$  is a mapping of vertices to the labels  $\{\text{dead}, \text{alive}\}$ , i.e., the state space  $\mathcal{X}$  is given via  $\mathcal{X} = (V \rightarrow \{\text{dead}, \text{alive}\})$ . Let  $x_t$  be a state that exists at time step  $t \in \mathbb{N}$ . We define

$$|v|_{x_t} = |\{w \mid w \in \text{surroundings}(v) \wedge x_t(w) = \text{alive}\}|.$$

In the game of life, the evolution of a state  $x_t$  to its subsequent state  $x_{t+1}$  is given deterministically via

$$x_{t+1}(v) = \begin{cases} \text{dead} & \text{if } |v|_{x_t} \leq 1, \\ x_t(v) & \text{if } |v|_{x_t} = 2, \\ \text{alive} & \text{if } |v|_{x_t} = 3, \\ \text{dead} & \text{if } |v|_{x_t} \geq 4, \end{cases}$$

for all  $v \in V$ . A tuple  $(G, x_0)$  is called an instance of the game of life for initial state  $x_0 \in \mathcal{X}$ .

Let's try
